

# Package ‘rata’

October 1, 2018

**Title** Manipulate Datasets Using A Stata-like Syntax

**Version** 0.0.1

**Description** This package implements tools for manipulating rectangular data sets (data sets with observations and variables) in a way that is familiar to users of a popular, but proprietary, statistical package commonly used in the social sciences.

**Depends** R (>= 3.5.1), Formula, foreign, readstata13, sandwich, plm,  
clubSandwich

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.0

**NeedsCompilation** no

**Author** Zach Flynn [aut, cre]

**Maintainer** Zach Flynn <zlflynn@gmail.com>

---

addobs	<i>add observations to the data set</i>
--------	---

---

**Description**

Add observations to the data set, similar in functionality to Stata’s append command

**Usage**

addobs(obs)

**Arguments**

- obs                      one of three possible input types:
- An R data frame with the same columns as the current dataset.
  - A comma-separated string in the following format: "var1=1,var2=2,var3=3" which inputs a single observation.
  - An integer in which case obs entirely missing observation are added to the dataset

---

capture	<i>captures an expression, returning 1 if there was an error and zero otherwise</i>
---------	---

---

**Description**

captures an expression, returning 1 if there was an error and zero otherwise

**Usage**

```
capture(expr, silent = FALSE)
```

**Arguments**

expr	an expression to be evaluated
silent	if TRUE, suppress error messages from printing (default: FALSE)

**Value**

0 if the expression successfully ran and 1 otherwise

**Examples**

```
capture({log(1)})  
capture({log(-1)})  
capture({log(x)}) # where x is not an already-created variable
```

---

clear	<i>clears the dataset in memory</i>
-------	-------------------------------------

---

**Description**

clears the dataset in memory

**Usage**

```
clear()
```

**Examples**

```
use(cars)  
listif()  
clear()  
listif()
```

---

collapse	<i>collapses a data set by variables using arbitrary aggregation functions</i>
----------	--

---

### Description

collapse a data set to produce summary statistics possibly by a set of variables as in the Stata code: collapse (fun1) var1 (fun2) var2, by(byvar1 byvar2). But this function is more flexible than the Stata version because any arbitrary function can be used in collapse not just traditional aggregation functions.

### Usage

```
collapse(values, byvar = NULL)
```

### Arguments

values	an argument with the form fun1(var1) fun2(var2) fun3(var3,var4) describe the aggregations to be performed where fun1, fun2, fun3 are most likely aggregation functions like "sum", "mean", "max", "median", etc. But could also be "reg" to perform regressions on different subsets, for example.
byvar	a variable list giving the variables to collapse by. The resulting dataset will have as many rows as there are unique levels of the byvar variable list.

### Examples

```
data(Produc)
use(Produc)
listif()
collapse("sum(emp)", "year")
listif()
```

---

count	<i>Counts how many observations (optionally, satisfying a condition)</i>
-------	--

---

### Description

Counts how many observations (optionally, satisfying a condition)

### Usage

```
count(ifstmt = NULL)
```

### Arguments

ifstmt	an optional argument which gives an condition that must be met for the observation to be counted
--------	--

### Examples

```
use(cars)
count()
count("speed <= 20")
```

---

describe	<i>lists the names of the variables in the dataset</i>
----------	--

---

**Description**

lists the names of the variables in the dataset

**Usage**

```
describe(pattern = NULL)
```

**Arguments**

pattern	an optional regular expression which only returns variable names that match the expression
---------	--

**Examples**

```
use(cars)
describe()
describe("s*")
```

---

destring	<i>convert a variable with string type into a numeric value</i>
----------	---

---

**Description**

convert a variable with string type into a numeric value

**Usage**

```
destring(varlist)
```

**Arguments**

varlist	variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.
---------	---

---

do	<i>Executes R code on the dataset</i>
----	---------------------------------------

---

### Description

Executes an R expression using variables from the dataset, possibly separately for each level of a given varlist (like the by prefix in Stata).

### Usage

```
do(expr, by = NULL)
```

### Arguments

expr	an R expression which can use any of the variable names in the current dataset
by	a variable list in either "var1 var2 var3" format or in ~var1+var2+var3 format. The R expression will be applied separately for the data subsetting to each level of the variable list.

### Examples

```
use(cars)
do("{coef(lm(speed~dist))}")
```

---

dropif	<i>drops rows from the dataset</i>
--------	------------------------------------

---

### Description

drops rows from the dataset

### Usage

```
dropif(x)
```

### Arguments

x	a condition like (ex: "var1==2") describing the observations that should be removed from the data set.
---	--

### Examples

```
use(cars)
listif()
dropif("speed <= 20")
listif()
```

---

dropvar	<i>drops variables in varlist format from the dataset</i>
---------	---

---

**Description**

drops variables in varlist format from the dataset

**Usage**

```
dropvar(x)
```

**Arguments**

x                      a varlist either in "var1 var2 var3" format or ~var1+var2+var3 format.

**Examples**

```
use(cars)
listif()
dropvar("speed")
listif()
use(cars)
dropvar(~speed)
listif()
```

---

estimates_print	<i>display estimation results</i>
-----------------	-----------------------------------

---

**Description**

display estimation results

**Usage**

```
estimates_print(name = NULL)
```

**Arguments**

name                      name of estimates to be replaced. If unspecified, print current estimates.

---

estimates_restore	<i>restore rata estimates</i>
-------------------	-------------------------------

---

**Description**

restore rata estimates

**Usage**

estimates\_restore(name)

**Arguments**

name	name of estimates to be restored
------	----------------------------------

---

estimates_save	<i>save rata estimates</i>
----------------	----------------------------

---

**Description**

save rata estimates

**Usage**

estimates\_save(file)

**Arguments**

file	file to save current estimates to.
------	------------------------------------

---

estimates_store	<i>store rata estimates</i>
-----------------	-----------------------------

---

**Description**

store rata estimates

**Usage**

estimates\_store(name)

**Arguments**

name	name to use to store current estimates from a rata estimation function like reg, logit, or probit.
------	--

---

estimates_use	<i>loads rata estimates from file</i>
---------------	---------------------------------------

---

**Description**

loads rata estimates from file

**Usage**

```
estimates_use(file)
```

**Arguments**

file	file to load estimates from.
------	------------------------------

---

fillin	<i>Fully rectangularize a dataset</i>
--------	---------------------------------------

---

**Description**

Make the dataset have one observation for every possible interaction of a list of variables.

**Usage**

```
fillin(varlist)
```

**Arguments**

varlist	a variable list in "var1 var2 var3 x*" format where "*" matches zero or more of any character and "?" matches one of any character (or a varlist in formula format, ~var1+var2+var3+x1+x2+...). On exit, the data set will contain one observation for every possible interaction of variables with missing values filled in where appropriate.
---------	---

---

forval	<i>Execute code in the datasets environment for all values of a vector, replacing a macro with the value in each iteration</i>
--------	--

---

**Usage**

```
forval(values, expr, macro = "%val")
```

**Arguments**

values	the vector of values to loop over. For example, specifying 1:5 would loop over integers from 1 to 5.
expr	a quoted expression to evaluate in the loop which (presumably) uses the macro expression
macro	a word to replace in the quoted expression with the values we are looping over (default: " Execute code in the datasets environment for all values of a vector, replacing a macro with the value in each iteration use(cars) listif() forval (2:4, "gen('speed%val', 'speed^%val')") listif()

---

forvar	<i>apply a function to each of a list of variables</i>
--------	--

---

**Description**

apply a function to each of a list of variables

**Usage**

```
forvar(varlist, action, macro = "%var")
```

**Arguments**

varlist	a list of variables in the format ~var1+var2+var3+... or as a vector of names like "var1 var2 var3".
action	a quoted expression to apply to each variable where the variable is represented in the expression by macro.
macro	an expression that will be replaced in action for each variable, by default %var.

**Examples**

```
use(cars)
forvar("speed dist", "gen('%var2', '%var^2')")
listif()
```

---

gen	<i>generates a new variable that is a transformation of existing variables in the dataset or replaces one</i>
-----	---

---

**Description**

generates a new variable that is a transformation of existing variables in the dataset or replaces one

**Usage**

```
gen(var, value, byvar = NULL, subset = NULL, replace = FALSE)
```

### Arguments

var	the name of the variable to be generated
value	the transformation of the dataset to replace the "newvar" in option form with. For example, value="sum(wage*female)" to get a variable which has total female wages. In Stata, the same command would be: "egen femalewage = total(wage*female)".
byvar	apply the value for each level of the by variables, specified either as a formula, like ~byvar1+byvar2+... or as a varlist "byvar1 byvar2 byvar3...".
subset	only generate values if the condition provided in subset is true. Make sure to enclose the expression in quotes, like so: subset="female==1 & highschool==1" to generate the values only for women who graduated from highschool. This option is used like the "if" in Stata.
replace	either TRUE or FALSE. If FALSE (default), the code refuses to alter the variable if the variable already exists. Otherwise, if replace=TRUE, then the values will be replaced.

---

headdata	<i>get first few observations</i>
----------	-----------------------------------

---

### Description

get first few observations

### Usage

```
headdata(num)
```

### Arguments

num	how many of the first observations to get
-----	---

---

keepif	<i>keeps some rows in the dataset and drops the rest</i>
--------	--

---

### Description

keeps some rows in the dataset and drops the rest

### Usage

```
keepif(x)
```

### Arguments

x	a condition like: "var1==2" in which case observations that satisfy the condition are kept and all others are removed.
---	--

**Examples**

```
use(cars)
keepif("speed <= 20")
listif()
```

---

keepvar	<i>keeps some variables in the dataset and drops the others</i>
---------	---

---

**Description**

keeps some variables in the dataset and drops the others

**Usage**

```
keepvar(x)
```

**Arguments**

x a varlist either of the form "var1 var2 var3" or in the form ~var1+var2+var3.

**Examples**

```
use(cars)
keepvar("speed")
listif()
use(cars)
keepvar(~speed)
listif()
```

---

L	<i>a function to take lags and leads with panel data</i>
---	--

---

**Description**

a function to take lags and leads with panel data, mostly a wrapper for plm's lag function.

**Usage**

```
L(x, k = 1, ...)
```

**Arguments**

x variable to lag  
k how many lags to take? If a negative number, leads will be generated.

**Examples**

```
use(Produc)
xtset("year", "state")
gen("Lemp", "L(emp)")
gen("L2emp", "L(emp,2)")
headdata(10)
```

---

listif	<i>prints the part of the dataset that satisfies certain conditions</i>
--------	---

---

**Description**

prints the part of the dataset that satisfies certain conditions

**Usage**

```
listif(cond = NULL, vars = NULL, ...)
```

**Arguments**

cond	a conditional expression; only observations that satisfy the condition will be returned.
vars	a variable list; only variables in the list will be returned.

**Value**

the part of the dataset that satisfies the condition and contains the specified columns

---

logit	<i>estimate a logistic regression</i>
-------	---------------------------------------

---

**Description**

estimate a logistic regression

**Usage**

```
logit(y, x, subset = NULL, weights = NULL, linkfunc = "logit", ...)
```

**Arguments**

y	name of the dependent variable
x	names of the independent variables in varlist format, either "x1 x2 x3" or ~x1+x2+X3 format.
subset	conditions to run the command only of a subset of the data (analogous to "if" statements in Stata)
weights	the name of a variable to use for weights in estimation
linkfunc	specify the linking function (logit, by default). Can set to "probit" to do probit estimation or use probit (which is equivalent).
...	other options to pass to glm

**Value**

b	coefficient vector
V	covariance matrix of coefficients

---

preserve	<i>preserve a data set before modification</i>
----------	--

---

**Description**

preserve a data set before modification

**Usage**

```
preserve(data = NULL)
```

**Arguments**

data                      a data set to preserve

**Value**

a value that can be passed to restore to restore the data set later

**Examples**

```
require(stats)
use(cars)
p <- preserve()
collapse(~mean(dist)|speed)
list()
restore(p)
list()
```

---

probit	<i>estimate a probit regression</i>
--------	-------------------------------------

---

**Description**

probit(...) is equivalent to logit(..., linkfunc="probit").

**Usage**

```
probit(...)
```

---

reg	<i>regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc</i>
-----	---

---

## Description

regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc.

## Usage

```
reg(y, x, subset = NULL, effect = NULL, robust = TRUE, hac = NULL,
    cluster = NULL, rtype = 1)
```

## Arguments

y	name of the dependent variable
x	names of the independent variables in either "x1 x2 x3" format or ~x1+x2+x3 format. To include a variable as a categorical variable (when you would use "i.state" to get state dummies in Stata), include it as "factor(state)".
subset	conditions to subset the data
effect	either "twoways", "individual", or "time" for fixed effects. Dataset must already have been xtset.
robust	whether to use robust standard errors
hac	which variable to order by to compute heteroskedastic and auto correlation standard errors (if unspecified, do not do HAC correction)
rtype	gives the type of heteroskedasticity correction to make. By default, it is "1" to implement HC1 which is the same as Stata's small sample corrected standard errors. rtype can be any integer from 0 to 3 with each value corresponding to a different heteroskedastic correction (HCx). See documentation for vcovHC in package sandwich.
clustvar	a variable list giving the names of the variables to cluster by in producing clustered standard errors

## Value

b coefficient vector  
 V covariance matrix of coefficients

---

rename	<i>renames variables in the dataset</i>
--------	---

---

**Description**

renames variables in the dataset

**Usage**

```
rename(var, newvar)
```

**Arguments**

var	the name of the variable to rename
newvar	the new name of the variable

**Examples**

```
use(cars)
listif()
rename("speed", "velocity")
listif()
```

---

restore	<i>restore a dataset from a previous preserve to be currently used</i>
---------	--

---

**Description**

restore a dataset from a previous preserve to be currently used

**Usage**

```
restore(envir)
```

**Arguments**

envir	a previous preserve value.
-------	----------------------------

**Value**

the preserved data set

**Examples**

```
require(stats)
use(cars)
p <- preserve()
collapse(~mean(dist)|speed)
list()
restore(p)
list()
```

---

savdata	<i>saves data to a CSV file</i>
---------	---------------------------------

---

### Description

saves data to a CSV file

### Usage

```
savdata(file)
```

### Arguments

file                      a file name to save the current data to

### Examples

```
use(Produc)
savdata("Produc.csv")
```

---

shape	<i>reshapes a data set from wide to long or from long to wide formats</i>
-------	---

---

### Description

reshapes a data set from wide to long or from long to wide formats

### Usage

```
shape(form, direction = "long")
```

### Arguments

form                      if direction="long", then the argument should have the form:  
id1+id2+...~newvar|stub  
where there are variables in the data set named "stubXXXX" and "newvar" is the name of the new variable that will be added to the data set which will contain the various values of "stubXXXX" on exit. The variable "stub" on exit will contain the value of "XXXX". Variables (id1,id2,...) will also be included in the dataset on exit. The command behaves like "reshape long stub, i(id1 id2 ...) j(newvar)" in Stata.  
If direction="wide", then the argument should have the form,  
id1+id2+...~values1+values2+...|byvar1+byvar2+...  
The variables (id1,id2,...,byvar1,byvar2,...) should uniquely identify observations in the data. On exit the dataset will contain (id1,id2,...) in addition to values1byvar1.byvar2, values2byvar1.byvar2, ... for each unique value of (byvar1,byvar2,...). The command behaves like "reshape wide values1 values2 ..., i(id1 id2 ...) j(byvar1...)"

direction                either "long" or "wide" to indicate the direction to reorient the data set

---

summarize	<i>summarize a variable list, giving basic descriptive statistics</i>
-----------	---

---

**Description**

summarize a variable list, giving basic descriptive statistics

**Usage**

```
summarize(varlist, detail = FALSE)
```

**Arguments**

varlist	a variable list either in "var1 var2 x*" form or ~var1+var2+x1+x2+x3 form.
detail	if TRUE, provide a more detailed output for each variable

---

taildata	<i>get last few observations</i>
----------	----------------------------------

---

**Description**

get last few observations

**Usage**

```
taildata(num)
```

**Arguments**

num	how many of the last few observations to get
-----	--

---

tostring	<i>convert a variable of another type into a string variable</i>
----------	--

---

**Description**

convert a variable of another type into a string variable

**Usage**

```
tostring(varlist)
```

**Arguments**

varlist	variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.
---------	---

---

use	<i>uses a dataset, marking it as the active dataset</i>
-----	---

---

### Description

uses a dataset, marking it as the active dataset

### Usage

```
use(x, clear = FALSE, ...)
```

### Arguments

x	usually either a data.frame or a csv/dta filename to be imported. An R function which returns a data.frame can also be specified.
clear	if TRUE, erase current data if it already exists (default: FALSE).

### Examples

```
Produc
use(Produc)
savedata("Produc.csv")
listif()
dropvar(".*")
```

---

varlist	<i>creates a formula object from a varlist, mostly for internal use.</i>
---------	--

---

### Description

A varlist in rata is either a space-separated string with wildcard characters, "var1 var2 var3 x\*", or an R formula object ~var1+var2+var3+x1+x2.... This function converts from the more user-friendly space-separated string format to the formula format.

### Usage

```
varlist(x)
```

### Arguments

x	the varlist to be converted in "var1 var2 var3" format. Can be specified using the <i>globbing</i> characters "*" (match zero or more of any character) or "?" (match any single character) like "var*" or "var?" for "var1 var2 var3" or using regular expressions if regex=TRUE ("var[0-9]+" = "var1 var2 var3").
---	---

### Value

a formula object which can be passed to model.frame

---

xtset	<i>prepares a panel dataset for lag operations</i>
-------	--

---

**Description**

prepares a panel dataset for lag operations. The lag function in R is simply "lag(var,numlags)". After calling xtset, this lag function will work on the panel in the way you would expect.

**Usage**

```
xtset(timevar, obsvar)
```

**Arguments**

timevar	the name of the variable to for the time dimension
obsvar	the name of the variable to use for the observation dimension

**Examples**

```
use(Produc)
xtset("year", "state")
gen("Lemp", "lag(emp)")
listif(vars="emp Lemp")
reg("emp", "unemp", effect="twoway")
reg("emp", "unemp", effect="obs")
reg("emp", "unemp", effect="time")
```
