Package 'genvar'

October 7, 2019

Title An Imperative Library for Data Manipulation
Version 0.0.1.4
Description Implements tools for manipulating data sets and performing regressions in a way that is familiar to users of a popular, but proprietary, statistical package commonly used in the social sciences. Loads a single dataset into memory and implements a set of imperative commands to modify that data and perform regressions and other analysis on the dataset. Offers an alternative to standard R's function-based approach to data manipulation.
Depends R ($>= 3.5.1.0$)
Imports Formula, foreign, readstata13, sandwich, plm, clubSandwich, lattice
License GPL-3
Encoding UTF-8
LazyData true
RoxygenNote 6.1.1
BugReports https://github.com/flynnzac/genvar
NeedsCompilation no
Author Zach Flynn [aut, cre]

addobs	add observations to the data set	_

Description

Add observations to the data set, similar in functionality to Stata's append command

assert_loaded 3

Usage

```
addobs(obs)
```

Arguments

obs

one of two possible input types:

- An R data frame with the same columns as the current dataset.
- A comma-separated string in the following format: "var1=1,var2=2,var3=3" which inputs a single observation.

Value

```
returns NULL, invisibly
```

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
keepvar("state year emp unemp")
addobs("state='Puerto Rico',year=1990,emp=100,unemp=5")
listif()
df <- data.frame(state=rep("Puerto Rico", times=2), year=1991:1992,emp=c(102,104),unemp=c(4.9,5.1))
addobs(df)
listif()</pre>
```

assert_loaded

assert a dataset is loaded in genvar and error otherwise

Description

assert a dataset is loaded in genvar and error otherwise

Usage

```
assert_loaded()
```

Value

```
returns NULL, invisibly
```

4 bigraph

bigraph	command to graph bivariate relationships
pigi apii	communa to graph orvanaic retationships

Description

bigraph plots bivariate relationships. it can plot multiple relationships on the same graph. It's a very simple command designed to make it easy to get basic plots up and going in a similar way to the other genvar commands. For more advanced graphics, use either lattice or ggplot2.

Usage

```
bigraph(type, xvars, yvars, xlines = NULL, ylines = NULL,
  title = NULL, xlabel = NULL, ylabel = NULL, xrange, yrange,
  style = NULL, color = NULL, size = NULL, output = "screen",
  resolution = "480x480", file, ...)
```

Arguments

type	a quoted list of plot types ("line" for line graphs, "connected" for line graphs with points indicating data points, and "scatter" for graphs with points for the data points). For example, to plot two lines and one scatter plot on the same graph: "line line scatter".
xvars	a varlist in "x1 x2 x3" form giving the variables to plot on the horizontal axis.
yvars	a varlist in "y1 y2 y3" form giving the variables to plot on the vertical axis
xlines	a list of numbers in the form "1 2 3" which gives the location on the x-axis to draw vertical lines
ylines	a list of numbers in the form "1 2 3" which gives the location on the y-axis to draw horizontal lines $\frac{1}{2}$
title	the title of the graph
xlabel	the label to use for the horizontal axis
ylabel	the label to use for the vertical axis
xrange	a list of numbers in the form "0 1" which gives the left and right end points of the horizontal axis. If omitted, the end points will be selected automatically to fit the data.
yrange	a list of numbers in the form "0 1" which gives the bottom and top end points of the vertical axis. If omitted, the end points will be selected automatically to fit the data.
style	a list of style options, one for each line or scatter on the graph, in the form "solid dashed dotted points". Can be any of the 1ty values from plot, like "solid", "dashed", "dotted", or just "points". If omitted, "solid" or "points" will be used for all, as appropriate.
color	a list of color options, one for each line or scatter on the graph in the form "black red blue". If omitted, the default option of the lattice package will be used (a blue color).

builddata 5

size	the line width or size of the points in the form "5 10 2". If omitted, default size will be used.
output	which kind of output to use. Currently, either "screen" for plotting to the screen or "png" for plotting to a png graphics file.
resolution	the resolution to use for the plot in the form "WxH" where W is width and H is height. The default is "480x480" for 480 pixels by 480 pixels.
file	the file to write to if using output="png".
	other options passed to directly to xyplot from the lattice package

Value

```
returns NULL, invisibly
```

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
gen("laborforce", "emp/(1-unemp/100)")
empfrac = function (emp, laborforce) sum(emp)/sum(laborforce)
collapse("empfrac(emp,laborforce)", "year")
rename("empfrac(emp, laborforce)", "empfrac")
destring("year")
bigraph("connected", xvars="year", yvars="empfrac",
title="Employment Percentage Over Time", style="solid",
color="black", size="3")
```

builddata

creates a dataset of a given number of observations

Description

Creates a dataset of a given number of observations. Does so by creating a variable called "v1" with all missing values.

Usage

```
builddata(n, replace = FALSE)
```

Arguments

n the number of observations to make the new dataset

replace if TRUE, replace a dataset in memory, if FALSE, error if a dataset is already

loaded

Value

```
returns NULL, invisibly
```

6 clear

Examples

```
builddata(100, replace=TRUE)
listif()
```

capture

captures an expression, setting getret("error") to TRUE if there was an error and FALSE otherwise

Description

captures an expression, setting getret("error") to TRUE if there was an error and FALSE otherwise

Usage

```
capture(expr, silent = FALSE)
```

Arguments

expr

an expression to be evaluated

silent

if TRUE, suppress error messages from printing (default: FALSE)

Value

FALSE if the expression successfully ran and TRUE otherwise

Examples

```
capture({log(1)})
capture({log(-1)})
```

clear

clears the dataset in memory

Description

removes a dataset from memory, errors if no dataset is loaded

Usage

clear()

Value

returns NULL invisibly

collapse 7

Examples

```
use(cars, clear=TRUE)
listif()
clear()
listif()
```

collapse

collapses a data set by variables using arbitrary aggregation functions

Description

collapse a data set to produce summary statistics possibly by a set of variables as in the Stata code: collapse (fun1) var1 (fun2) var2, by(byvar1 byvar2). But this function is more flexible than the Stata version because any arbitrary function can be used in collapse not just traditional aggregation functions.

Usage

```
collapse(values, byvar = NULL)
```

Arguments

values an argument with the form "fun1(var1) fun2(var2) fun3(var3, var4)" de-

scribe the aggregations to be performed where fun1, fun2, fun3 are most likely aggregation functions like "sum", "mean", "mean", "median", etc. But could also

be "reg" to perform regressions on different subsets, for example.

byvar a variable list giving the variables to collapse by. The resulting dataset will have

as many rows as there are unique levels of the byvar variable list.

Value

```
returns NULL, invisibly
```

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
listif()
collapse("sum(emp)", "year")
listif()
```

8 describe

count

Counts how many observations (optionally, satisfying a condition)

Description

Counts how many observations (optionally, satisfying a condition)

Usage

```
count(ifstmt = NULL)
```

Arguments

ifstmt

an optional argument which gives an condition that must be met for the observation to be counted

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
count()
count("speed <= 20")</pre>
```

describe

lists the names of the variables in the dataset

Description

lists the names of the variables in the dataset

Usage

```
describe(pattern = NULL)
```

Arguments

pattern

an optional regular expression which only returns variable names that match the expression

Value

A vector of names of variables with an attribute called "type" giving the types of the variables. The class of the object is "varlist".

destring 9

Examples

```
use(cars, clear=TRUE)
describe()
describe("s*")
```

destring

convert a variable with string type into a numeric value

Description

convert a variable with string type into a numeric value

Usage

```
destring(varlist)
```

Arguments

varlist

variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
tostring("speed")
listif()
describe()
destring("speed")
listif()
describe()
```

do

Executes R code on the dataset

Description

Executes an R expression using variables from the dataset, possibly separately for each level of a given varlist (like the by prefix in Stata).

Usage

```
do(expr, by = NULL)
```

10 dropif

Arguments

expr an R expression which can use any of the variable names in the current dataset

by a variable list in either "var1 var2 var3" format or in ~var1+var2+var3 format.

The R expression will be applied separately for the data subsetted to each level

of the variable list.

Value

returns whatever the expression expr returns

Examples

```
use(cars, clear=TRUE)
do("{coef(lm(speed~dist))}")
```

dropif

drops rows from the dataset

Description

drops rows from the dataset

Usage

```
dropif(x)
```

Arguments

Х

a condition like (ex: "var1==2") describing the observations that should be removed from the data set.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
listif()
dropif("speed <= 20")
listif()</pre>
```

dropvar 11

dropvar

drops variables in varlist format from the dataset

Description

drops variables in varlist format from the dataset

Usage

```
dropvar(x)
```

Arguments

Χ

a varlist either in "var1 var2 var3" format or ~var1+var2+var3 format.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
listif()
dropvar("speed")
listif()
use(cars, clear=TRUE)
dropvar(~speed)
listif()
```

estimates_print

display estimation results

Description

display estimation results

Usage

```
estimates_print(name = NULL)
```

Arguments

name

name of estimates to be replaced. If unspecified, print current estimates.

12 estimates_save

estimates_restore

restore genvar estimates

Description

restore genvar estimates

Usage

```
estimates_restore(name)
```

Arguments

name

name of estimates to be restored

Value

returns NULL, invisibly

estimates_save

save genvar estimates

Description

save genvar estimates

Usage

```
estimates_save(file)
```

Arguments

file

file to save current estimates to.

Value

returns NULL, invisibly

estimates_store 13

estimates_store

store genvar estimates

Description

store genvar estimates

Usage

```
estimates_store(name)
```

Arguments

name

name to use to store current estimates from a genvar estimation function like reg, logit, or probit.

Value

returns NULL, invisibly

estimates_use

loads genvar estimates from file

Description

loads genvar estimates from file

Usage

```
estimates_use(file)
```

Arguments

file

file to load estimates from.

Value

returns NULL, invisibly

14 forval

fillin	Fully rectangularize a dataset
--------	--------------------------------

Description

Make the dataset have one observation for every possible interaction of a list of variables.

Usage

```
fillin(varlist)
```

Arguments

varlist

a variable list in "var1 var2 var3 x^* " format where "*" matches zero or more of any character and "?" matches one of any character (or a varlist in formula format, \sim var1+var2+var3+x1+x2+...). On exit, the data set will contain one observation for every possible interaction of variables with missing values filled in where appropriate.

Value

returns NULL, invisibly

forval	Execute code in the datasets environment for all values of a vector,
	replacing a macro with the value in each iteration

Description

Execute code in the datasets environment for all values of a vector, replacing a macro with the value in each iteration

Usage

```
forval(values, expr, macro = "%val")
```

Arguments

values	the vector of values to loop over. For example, specifying 1:5 would loop over integers from 1 to 5 .
expr	a quoted expression to evaluate in the loop which (presumably) uses the macro expression
macro	a word to replace in the quoted expression with the values we are looping over (default: "%val")

forvar 15

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
listif()
forval (2:4, "gen('speed%val', 'speed^%val')")
listif()
```

forvar

apply a function to each of a list of variables

Description

apply a function to each of a list of variables

Usage

```
forvar(varlist, action, macro = "%var")
```

Arguments

varlist a list of variables in the format ~var1+var2+var3+... or as a vector of names like

"var1 var2 var3".

action a quoted expression to apply to each variable where the variable is represented

in the expression by macro.

macro an expression that will be replaced in action for each variable, by default %var.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
forvar("speed dist", "gen('%var2', '%var^2')")
listif()
```

16 getdata

gen	generates a new variable that is a transformation of existing variables in the dataset or replaces one

Description

generates a new variable that is a transformation of existing variables in the dataset or replaces one

Usage

```
gen(var, value, byvar = NULL, subset = NULL, replace = FALSE)
```

Arguments

var	the name of the variable to be generated
value	the transformation of the dataset to replace the "newvar" in option form with. For example, value="sum(wage*female)" to get a variable which has total female wages. In Stata, the same command would be: "egen femalewage = total(wage*female)".
byvar	apply the value for each level of the by variables, specified either as a formula, like ~byvar1+byvar2+ or as a varlist "byvar1 byvar2 byvar3".
subset	only generate values if the condition provided in subset is true. Make sure to enclose the expression in quotes, like so: subset="female==1 & highschool==1" to generate the values only for women who graduated from highschool. This option is used like the "if" in Stata.
replace	either TRUE or FALSE. If FALSE (default), the code refuses to alter the variable

if the variable already exists. Otherwise, if replace=TRUE, then the values will

Value

returns NULL, invisibly

getdata exports data frame from genvar environment to R environment

Description

exports data frame from genvar environment to R environment

Usage

getdata()

Value

the data frame currently in the genvar environment

be replaced.

headdata 17

headdata

get first few observations

Description

get first few observations

Usage

headdata(num)

Arguments

num

how many of the first observations to get

Value

returns the first num rows of data

is_loaded

a command to determine whether data is loaded

Description

a command to determine whether data is loaded

Usage

is_loaded()

Value

returns TRUE if dataset is loaded in genvar and FALSE otherwise

18 keepvar

keepif

keeps some rows in the dataset and drops the rest

Description

keeps some rows in the dataset and drops the rest

Usage

```
keepif(x)
```

Arguments

Χ

a condition like: "var1==2" in which case observations that satisfy the condition are kept and all others are removed.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
keepif("speed <= 20")
listif()</pre>
```

keepvar

keeps some variables in the dataset and drops the others

Description

keeps some variables in the dataset and drops the others

Usage

```
keepvar(x)
```

Arguments

Χ

a varlist either of the form "var1 var2 var3" or in the form ~var1+var2+var3.

Value

```
returns NULL, invisibly
```

L 19

Examples

```
use(cars, clear=TRUE)
keepvar("speed")
listif()
use(cars, clear=TRUE)
keepvar(~speed)
listif()
```

L

a function to take lags and leads with panel data

Description

a function to take lags and leads with panel data, mostly a wrapper for plm's lag function.

Usage

```
L(x, k = 1, ...)
```

Arguments

x variable to lag
k how many lags to take? If a negative number, leads will be generated.
... other options to pass to plm::lag, does not need to be specified

Value

returns lag of the variable as a data frame

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
xtset("year", "state")
gen("Lemp", "L(emp)")
gen("L2emp", "L(emp,2)")
headdata(10)
```

20 logit

listif	prints the part of the dataset that satisfies certain conditions

Description

prints the part of the dataset that satisfies certain conditions

Usage

```
listif(cond = NULL, vars = NULL, ...)
```

Arguments

cond a conditional expression; only observations that satisfy the condition will be

returned.

vars a variable list; only variables in the list will be returned.

... other options, currently ignored

Value

the part of the dataset that satisfies the condition and contains the specified columns

logit estimate a logistic regression

Description

estimate a logistic regression

Usage

```
logit(y, x, subset = NULL, weights = NULL, linkfunc = "logit", ...)
```

Arguments

У	name of the dependent variable
x	names of the independent variables in varlist format, either "x1 x2 x3" or \sim x1+x2+X3 format.
subset	conditions to run the command only of a subset of the data (analogous to "if" statements in Stata)
weights	the name of a variable to use for weights in estimation
linkfunc	specify the linking function (logit, by default). Can set to "probit" to do probit estimation or use probit (which is equivalent).
	other options to pass to glm

pred 21

Value

b coefficient vector

V covariance matrix of coefficients

pred

gets fitted values from a genvar regression object

Description

Gets fitted values from a genvar regression object. For panel models, this predicts the non-fixed effects part of the regression.

Usage

```
pred()
```

Details

Operates on the loaded estimation object, see estimates_use.

Value

returns predictions from model

Examples

```
use(cars, clear=TRUE)
listif()
reg("dist", "speed")
gen("fit", "pred()")
listif()
```

preserve

preserve a data set before modification

Description

preserve a data set before modification

Usage

```
preserve(data = NULL)
```

Arguments

data

a data set to preserve

22 reg

Value

a value that can be passed to restore to restore the data set later

Examples

```
require(stats)
use(cars, clear=TRUE)
p <- preserve()
collapse("mean(dist)", "speed")
list()
restore(p, replace=TRUE)
list()</pre>
```

probit

estimate a probit regression

Description

```
probit(...) is equivalent to logit(..., linkfunc="probit").
```

Usage

```
probit(...)
```

Arguments

... options to pass to logit

reg

regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc

Description

regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc.

Usage

```
reg(y, x, subset = NULL, effect = NULL, robust = TRUE, hac = NULL,
  cluster = NULL, rtype = 1)
```

rename 23

Arguments

y name of the dependent variable
x names of the independent variables in either "x1 x2 x

names of the independent variables in either "x1 x2 x3" format or ~x1+x2+x3

format. To include a variable as a categorical variable (when you would use

"i.state" to get state dummies in Stata), include it as "factor(state)".

subset conditions to subset the data

effect either "twoways", "individual", or "time" for fixed effects. Dataset must already

have been xtset.

robust whether to use robust standard errors

hac which variable to order by to compute heteroskedastic and auto correlation stan-

dard errors (if unspecified, do not do HAC correction)

cluster a variable list giving the names of the variables to cluster by in producing clus-

tered standard errors

rtype gives the type of heteroskedasticity correction to make. By default, it is "1" to

implement HC1 which is the same as Stata's small sample corrected standard errors. rtype can be any integer from 0 to 3 with each value corresponding to a different heteroskedastic correction (HCx). See documention for vcovHC in

package sandwich.

Value

b coefficient vector

V covariance matrix of coefficients

rename renames variables in the dataset

Description

renames variables in the dataset

Usage

rename(var, newvar)

Arguments

var the name of the variable to rename newvar the new name of the variable

Value

returns NULL, invisibly

24 restore

Examples

```
use(cars, clear=TRUE)
listif()
rename("speed","velocity")
listif()
```

restore

restore a dataset from a previous preserve to be currently used

Description

restore a dataset from a previous preserve to be currently used

Usage

```
restore(envir, replace = FALSE)
```

Arguments

envir a previous preserve value.

replace if TRUE, restore even if another dataset is in memory. If FALSE, do not.

Value

the preserved data set

Examples

```
require(stats)
use(cars, clear=TRUE)
p <- preserve()
collapse("mean(dist)","speed")
list()
restore(p, replace=TRUE)
list()</pre>
```

savedata 25

savedata

saves data to a CSV or RDS file

Description

```
saves data to a CSV or RDS file
```

Usage

```
savedata(file, rds = FALSE)
```

Arguments

file a file name to save the current data to

rds whether to save the file to an RDS file (default: FALSE)

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
savedata(file.path(tempdir(), "cars.csv"))
savedata(file.path(tempdir(), "cars.rds"), rds=TRUE)
```

shape

reshapes a data set from wide to long or from long to wide formats

Description

reshapes a data set from wide to long or from long to wide formats

Usage

```
shape(form, direction = "long")
```

Arguments

form

if direction="long", then the argument should have the form:

id1+id2+..~newvarlstub

where there are variables in the data set named "stubXXXX" and "newvar" is the name of the new variable that will be added to the data set which will contain the various values of "stubXXXX" on exit. The variable "stub" on exit will contain the value of "XXXX". Variables (id1,id2,...) will also be included in the dataset

26 subset.varlist

> on exit. The command behaves like "reshape long stub, i(id1 id2 ...) j(newvar)" in Stata.

If direction="wide", then the argument should have the form,

id1+id2+...~values1+values2+...lbyvar1+byvar2+...

The variables (id1,id2,...,byvar1,byvar2,...) should uniqely identify observations in the data. On exit the dataset will contain (id1,id2,...) in addition to values1byvar1.byvar2, values2byvar1.byvar2, ... for each unique value of (byvar1,byvar2,...). The command behaves like "reshape wide values1 values2 ...,

i(id1 id2 ...) j(byvar1...)

direction

either "long" or "wide" to indicate the direction to reorient the data set

Value

returns NULL, invisibly

subset.varlist

generate a varlist that is a subset of another

Description

generate a varlist that is a subset of another

Usage

```
## S3 method for class 'varlist'
subset(x, vars, ...)
```

Arguments

a varlist Х

a set of variable names vars

currently ignored . . .

Value

returns the subset of variable names with attibute "type" giving the types. The vector is of class "varlist"

summarize 27

summarize

summarize a variable list, giving basic descriptive statistics

Description

summarize a variable list, giving basic descriptive statistics

Usage

```
summarize(varlist, detail = FALSE)
```

Arguments

varlist a variable list either in "varl var2 x*" form or ~var1+var2+x1+x2+x3 form.

detail if TRUE, provide a more detailed output for each variable

Value

returns NULL, invisibly

taildata

get last few observations

Description

get last few observations

Usage

taildata(num)

Arguments

num

how many of the last few observations to get

Value

returns last num rows of data

28 use

tostring

convert a variable of another type into a string variable

Description

convert a variable of another type into a string variable

Usage

```
tostring(varlist)
```

Arguments

varlist

variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.

Value

```
returns NULL, invisibly
```

Examples

```
use(cars, clear=TRUE)
tostring("speed")
listif()
```

use

uses a dataset, marking it as the active dataset

Description

uses a dataset, marking it as the active dataset

Usage

```
use(x, clear = FALSE, type = NULL, ...)
```

Arguments

X	usually either a data.frame or a csv/dta filename to be imported. An R function which returns a data.frame can also be specified.
clear	if TRUE, erase current data if it already exists (default: FALSE).
type	either "csv" or "dta" for loading csv or dta data set
	other options to pass to read.csv in case x is a csv file or to read.dta or read.dta13 depending on the type of file being loaded

varlist 29

Value

```
returns NULL invisibly
```

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
listif()
dropvar(".*")
```

varlist

creates a formula object from a varlist, mostly for internal use.

Description

A varlist in genvar is either a space-separated string with wildcard characters, "var1 var2 var3 x*", or an R formula object ~var1+var2+var3+x1+x2.... This function converts from the more user-friendly space-separated string format to the formula format or to a vector of strings.

Usage

```
varlist(x, type = "formula")
```

Arguments

Х

the varlist to be converted in "var1 var2 var3" format. Can be specified using the *globbing* characters "*" (match zero or more of any character) or "?" (match any single character) like "var*" or "var?" for "var1 var2 var3" or using regular expressions if regex=TRUE ("var[0-9]+" = "var1 var2 var3").

type

if "formula", return a varlist in formula format; if "vector", return a varlist in character vector format.

Value

a formula object which can be passed to model. frame or a character vector giving the name of each variable

30 xtset

xtset

prepares a panel dataset for lag operations

Description

prepares a panel dataset for lag operations. The lag function in R is simply "lag(var,numlags)". After calling xtset, this lag function will work on the panel in the way you would expect.

Usage

```
xtset(timevar, obsvar)
```

Arguments

timevar the name of the variable to for the time dimension

obsvar the name of the variable to use for the observation dimension

Value

```
returns NULL, invisibly
```

Examples

```
library(plm)
data(Produc)
use(Produc, clear=TRUE)
xtset("year", "state")
gen("Lemp", "lag(emp)")
listif(vars="emp Lemp")
reg("emp", "unemp", effect="twoway")
reg("emp", "unemp", effect="individual")
reg("emp", "unemp", effect="time")
```
