Package 'rata'

September 24, 2018

Title Manipulate Datasets Using A Stata-like Syntax

Version 0.0.1

Description This package implements tools for manipulating rectangular data sets (data sets with observations and variables) in a way that is familiar to users of a popular, but proprietary, statistical package commonly used in the social sciences.

Depends R (>= 3.5.1), Formula, foreign, readstata13, sandwich

License GPL-3

Encoding UTF-8

LazyData true

RoxygenNote 6.1.0

NeedsCompilation no

Author Zach Flynn [aut, cre]

Maintainer Zach Flynn <zlflynn@gmail.com>

R topics documented:

---

addobs   *add observations to the data set*

Description

Add observations to the data set, similar in functionality to Stata's append command

Usage

```
addobs(obs)
```

Arguments

obs   one of three possible input types:

- An R data frame with the same columns as the current dataset.
- A comma-separated string in the following format: "var1=1,var2=2,var3=3" which inputs a single observation.
- An integer in which case obs entirely missing observation are added to the dataset

---

collapse   *collapses a data set by variables using arbitrary aggregation functions*

Description

collapses a data set by variables using arbitrary aggregation functions

Usage

```
collapse(form)
```

Arguments

form   an argument with the form

                    `~fun1(var1)+fun2(var2)+fun3(var3)+...|byvar1+byvar2+...`

                    where fun1, fun2, and fun3 are aggregation functions like "mean", "sum", "max", etc. data will contain all unique levels of (byvar1,byvar2,...) and fun1(var1),fun2(var2) evaluated on the subset of the data set with that value of the by variables. The equivalent Stata is: collapse (fun1) var1 (fun2) var2 (fun3) var3 ..., by(byvar1 byvar2)

Examples

```
data(Produc)
use(Produc)
listif()
collapse(~sum(emp)|year)
listif()
```

---

count   *Counts how many observations (optionally, satisfying a condition)*

Description

Counts how many observations (optionally, satisfying a condition)

Usage

```
count(ifstmt = NULL)
```

Arguments

ifstmt   an optional argument which gives an condition that must be met for the observation to be counted

Examples

```
use(cars)
count()
count("speed <= 20")
```

---

describe   *lists the names of the variables in the dataset*

Description

lists the names of the variables in the dataset

Usage

```
describe(pattern = NULL)
```

Arguments

pattern   an optional regular expression which only returns variable names that match the expression

Examples

```
use(cars)
describe()
describe("^s")
```

---

destring   *turn a variable with string type into a numeric value*

Description

turn a variable with string type into a numeric value

Usage

```
destring(varlist)
```

Arguments

varlist   variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.

---

do   *Executes R code on the dataset*

Description

Executes an R expression using variables from the dataset, possibly separately for each level of a given varlist (like the by prefix in Stata).

Usage

```
do(expr, by = NULL)
```

Arguments

expr   an R expression which can use any of the variable names in the current dataset

by   a variable list in either "var1 var2 var3" format or in ~var1+var2+var3 format.
                The R expression will be applied separately for the data subsetted to each level
                of the variable list.

Examples

```
use(cars)
do("{coef(lm(speed~dist))}")
```

---

 dropif   *drops rows from the dataset*

Description

drops rows from the dataset

Usage

```
dropif(x)
```

Arguments

x   a condition like (ex: "var1==2") describing the observations that should be re-
                moved from the data set.

Examples

```
use(cars)
listif()
dropif("speed <= 20")
listif()
```

| dropvar | *drops variables in varlist format from the dataset* |

Description

drops variables in varlist format from the dataset

Usage

```
dropvar(x)
```

Arguments

x   a varlist either in "var1 var2 var3" format or ~var1+var2+var3 format.

Examples

```
use(cars)
listif()
dropvar("speed")
listif()
use(cars)
dropvar(~speed)
listif()
```

| fillin | *Fully rectangularize a dataset* |

Description

Make the dataset have one observation for every possible interaction of a list of variables.

Usage

```
fillin(varlist)
```

Arguments

varlist   a variable list in "var1 var2 var3 x*" format where "*" matches zero or more
                 of any character and "?" matches one of any character (or a varlist in formula
                 format, ~var1+var2+var3+x1+x2+...). On exit, the data set will contain one
                 observation for every possible interaction of variables with missing values filled
                 in where appropriate.

---

forvar	*apply a function to each of a list of variables*

Description

apply a function to each of a list of variables

Usage

```
forvar(varlist, action, macro = "%var")
```

Arguments

varlist	a list of variables in the format ~var1+var2+var3+... or as a vector of names like "var1 var2 var3".
action	a quoted expression to apply to each variable where the variable is represented in the expression by macro.
macro	an expression that will be replaced in action for each variable, by default %var.

Examples

```
use(cars)
forvar("speed dist", "gen('%var2', '%var^2')")
listif()
```

---

gen	*generates a new variable that is a transformation of existing variables in the dataset or replaces one*

Description

generates a new variable that is a transformation of existing variables in the dataset or replaces one

Usage

```
gen(var, value, byvar = NULL, subset = NULL, replace = FALSE)
```

Arguments

var	the name of the variable to be generated
value	the transformation of the dataset to replace the "newvar" in option form with. For example, value="sum(wage*female)" to get a variable which has total female wages. In Stata, the same command would be: "egen femalewage = total(wage*female)".

byvar	apply the value for each level of the by variables, specified either as a formula, like ~byvar1+byvar2+... or as a varlist "byvar1 byvar2 byvar3...".
subset	only generate values if the condition provided in subset is true. Make sure to enclose the expression in quotes, like so: subset="female==1 & highschool==1" to generate the values only for women who graduated from highschool. This option is used like the "if" in Stata.
replace	either TRUE or FALSE. If FALSE (default), the code refuses to alter the variable if the variable already exists. Otherwise, if replace=TRUE, then the values will be replaced.

---

keepif   *keeps some rows in the dataset and drops the rest*

Description

keeps some rows in the dataset and drops the rest

Usage

```
keepif(x)
```

Arguments

x	a condition like: "var1==2" in which case observations that satisfy the condition are kept and all others are removed.

Examples

```
use(cars)
keepif("speed <= 20")
listif()
```

---

keepvar   *keeps some variables in the dataset and drops the others*

Description

keeps some variables in the dataset and drops the others

Usage

```
keepvar(x)
```

Arguments

x	a varlist either of the form "var1 var2 var3" or in the form ~var1+var2+var3.

Examples

```
use(cars)
keepvar("speed")
listif()
use(cars)
keepvar(~speed)
listif()
```

---

listif	*prints the part of the dataset that satisfies certain conditions*

Description

prints the part of the dataset that satisfies certain conditions

Usage

```
listif(cond = NULL, ...)
```

Value

the part of the dataset that satisfies the condition and contains the specified columns

---

preserve	*preserve a data set before modification*

Description

preserve a data set before modification

Usage

```
preserve(data = NULL)
```

Arguments

data   a data set to preserve

Value

a value that can be passed to `restore` to restore the data set later

Examples

```
require(stats)
use(cars)
p <- preserve()
collapse(~mean(dist)|speed)
list()
restore(p)
list()
```

---

reg	*regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc*

Description

regress y on x with robust standard errors, clustered standard errors, HAC standard errors, panel fixed effects, etc

Usage

```
reg(y, x, subset = NULL, effect = NULL, robust = TRUE, hac = NULL,
  cluster = NULL)
```

Arguments

y	name of the dependent variable
x	names of the independent variables in either "x1 x2 x3" format or ~x1+x2+x3 format.
subset	conditions to subset the data
effect	either "twoway", "obs", or "time" for fixed effects,
robust	whether to use robust standard errors
hac	which kernel to use for heteroskedastic and auto correlation standard errors
cluster	the name of the variable to use for clustered standard errors

Value

b coefficient vector

V covariance matrix of coefficients

---

rename	*renames variables in the dataset*

Description

renames variables in the dataset

Usage

```
rename(var, newvar)
```

Arguments

var	the name of the variable to rename
newvar	the new name of the variable

Examples

```
use(cars)
listif()
rename("speed","velocity")
listif()
```

---

restore	*restore a dataset from a previous preserve to be currently used*

Description

restore a dataset from a previous preserve to be currently used

Usage

```
restore(envir)
```

Arguments

envir	a previous preserve value.

Value

the preserved data set

Examples

```
require(stats)
use(cars)
p <- preserve()
collapse(~mean(dist)|speed)
list()
restore(p)
list()
```

---

savedata   *saves data to a CSV file*

Description

saves data to a CSV file

Usage

```
savedata(file)
```

Arguments

file   a file name to save the current data to

Examples

```
use(Produc)
savedata("Produc.csv")
```

---

shape   *reshapes a data set from wide to long or from long to wide formats*

Description

reshapes a data set from wide to long or from long to wide formats

Usage

```
shape(form, direction = "long")
```

Arguments

form	if direction="long", then the argument should have the form:
	id1+id2+..~newvar|stub
	where there are variables in the data set named "stubXXXX" and "newvar" is the name of the new variable that will be added to the data set which will contain the various values of "stubXXXX" on exit. The variable "stub" on exit will contain the value of "XXXX". Variables (id1,id2,...) will also be included in the dataset on exit. The command behaves like "reshape long stub, i(id1 id2 ...) j(newvar)" in Stata.
	If direction="wide", then the argument should have the form,
	id1+id2+...~values1+values2+...|byvar1+byvar2+...
	The variables (id1,id2,...,byvar1,byvar2,...) should uniqely identify observations in the data. On exit the dataset will contain (id1,id2,...) in addition to values1byvar1.byvar2, values2byvar1.byvar2, ... for each unique value of (byvar1,byvar2,...). The command behaves like "reshape wide values1 values2 ..., i(id1 id2 ...) j(byvar1...)
direction	either "long" or "wide" to indicate the direction to reorient the data set

---

tostring	*turn a variable of another type into a string variable*

Description

turn a variable of another type into a string variable

Usage

```
tostring(varlist)
```

Arguments

varlist	variables to convert, either in the form "var1 var2 var3" or in the form ~var1+var2+var3.

---

use	*uses a dataset, marking it as the active dataset*

Description

uses a dataset, marking it as the active dataset

Usage

```
use(x, ...)
```

Arguments

x   usually either a data.frame or a csv/dta filename to be imported. An R function
                            which returns a data.frame can also be specified.

Examples

```
Produc
use(Produc)
savedata("Produc.csv")
listif()
dropvar(".*")
```

---

varlist   *creates a formula object from a varlist, mostly for internal use.*

Description

A varlist in `rata` is either a space-separated string with wildcard characters, "var1 var2 var3 x*", or
an R formula object ~var1+var2+var3+x1+x2.... This function converts from the more user-friendly
space-separated string format to the formula format.

Usage

```
varlist(x)
```

Arguments

x   the varlist to be converted in "var1 var2 var3" format. Can be specified using
                            the *globbing* characters "*" (match zero or more of any character) or "?" (match
                            any single character) like "var*" or "var?" for "var1 var2 var3" or using regular
                            expressions if `regex=TRUE` ("var[0-9]+" = "var1 var2 var3").

Value

a formula object which can be passed to `model.frame`

---

xtset *prepares a panel or time series dataset for lag operations*

Description

prepares a panel or time series dataset for lag operations

Usage

```
xtset(timevar = NULL, obsvar = NULL)
```

Arguments

timevar   the name of the variable to for the time dimension

obsvar   the name of the variable to use for the observation dimension

Examples

```
use(Produc)
xtset("year", "state")
reg("emp", "unemp", effect="twoway")
reg("emp", "unemp", effect="obs")
reg("emp", "unemp", effect="time")
```
